

ABSTRACT

A method for providing a service in a controlled run-time environment. The method comprises registering a proxy service in the controlled run-time environment wherein the proxy service implements an interface defined according to the controlled run-time environment to enable services operating in the controlled run-time environment to interoperate with the service, receiving service information by the proxy service from a local service executing in the controlled run-time environment via an interface method of the proxy service, communicating the service information to a remote service from the proxy service, receiving processed information from the remote service in response to the communicating, and returning the processed information to the local service from the proxy service.
